Apateq partners with Canada's Fluid Clarification

27 July 2015

Fracking flowback and produced water treatment equipment provider Apateq PWT SA has entered into a strategic partnership with Fluid Clarification LP, a provider of advanced separations technology for the oil & gas market in Canada.

Fluid Clarification will distribute Apateq's products in Canada from its headquarters in Calgary. The Apateq product range covers produced water and fracking flowback treatment systems for oil and gas field operators as well compact wastewater treatment plants for demanding applications and systems for the treatment of industrial process water and wastewater.

Apateq will also open a subsidiary in the US during 2015.

"We are delighted about the trust of Fluid Clarification in our technology and its implementation, as well as in our high-quality systems. The cooperation will increase our international presence and offers the opportunity to enter new markets," said Apateq CEO Bogdan Serban.

"This collaboration combines proven technology and reliable engineering with our many years of market experience," said Arthur Potts, Fluid Clarification founder and CEO. "It enables Fluid Clarification to expand its product portfolio with the highest performance membrane based oil-water separation systems, using the best engineering capabilities available."

Founded in Luxembourg in early 2013, Apateq has successfully developed and sold equipment that is currently operated in Europe and North America. The first large scale installation of Apateq's produced water and fracking flowback treatment plant OilPaq in North America will be commissioned later this year.
